Complex random vectors are commonly used in applications such as wireless communications, harmonic analysis, biomedical sensors (e.g., fMRI), sensor array signal processing, and radar. Many spectrally efficient modulation schemes as well as some of the recent radio transceiver developments are prime examples of this, all being based on

Usual books on biomedical signals are focussed on the detection and processing of signals, while their closer physiological interpretation is left to the physician or the biologist. In the here given case, the author provides a clear physiological basis, prior to the discussion of the corresponding signals.
