CT and MRI of the Whole Body 2-Volume Set - 9780323113281

The main difference
between a CT Scan and
an MRI is the way the
two scanning devices
work. The CT scan uses

x-rays to scan the body
and to capture pictures
in the details. CT Scan
exposes one to forms
of radiation. The CT
machines have
become faster over
time thus the patient is
exposed to a lower
level of radiation
today.

Works. For both CT (left) and MRI (right) scans you will lie on a moving table and be put into a circular machine that looks like a big doughnut. The table will move your body into the doughnut hole. The scan will then be performed. You may or may not get IV contrast through an IV.

CT scans utilize X-rays to produce images of the inside of the body while MRI (magnetic resonance imaging) uses powerful magnetic fields and radio frequency pulses to produce detailed pictures of organs and other internal body structures. CT scans use radiation (X-rays),

An MRI differs from a CAT scan (also called a CT scan or a computed axial tomography scan) because it does not use radiation. MRI scans are better for imaging water-containing tissue.
